DESCRIPTORS: *Blood, *Heparin, *Arteriosclerosis, Diagnosis.

In atherosclerotic patients, progress of the disease is characterized by a rise in the blood heparin level, reaching in average of 8.5 units/ml in chronic coronary insufficiency and of 10.2 units/ml in acute myocardial infarction (normal 6.6 units/ml). Investigation of the clearing factor in 68 subjects revealed a tendency for it to diminish in atherosclerosis (8.9%), par-

DESCRIPTORS: Blood chemistry, *Blood proteins, *Spectrographic analysis, *Pneumonia, *Cancer, *Lungs, Body temperature, Albumins, Globulins, Diagnosis.

Changes in the protein spectrum of blood serum in chronic pneumonia and lung cancer are reflected in hypoalbuminemia and hyperglobulinemia. In the globulin spectrum there is a particular increase in the level of the α_2-fraction and, in a number of patients, in the γ-fraction.
